

Virtual tours: what we need from you

The website side is built and tested. Everything still outstanding is material that has to be captured or rendered before a tour can exist — and that is a decision and a booking, not a piece of code.

1 — THE THING WORTH KNOWING FIRST

A virtual tour is filmed, not programmed

We examined the reference you sent, aureliaresidences.com/virtual-tour. Its page is five embedded frames: four tours hosted by **iStaging** and one by **Matterport**. There is no custom 3D on that website at all.

That is how essentially every property virtual tour works, and it changes what we are asking you for:

- A camera operator visits a finished room and scans it, *or* 360° panoramas are rendered from the architect's model for something not yet built.
- A platform processes that into a walkable tour and hosts it, giving back one link per tour.
- The website embeds the link. **That part is already done.**

So the honest position: we cannot build you a tour of Curve or H4 from here. Nobody can. Somebody has to stand in the room with a camera, or render the panoramas from the model. What we have built is everything that happens after that.

2 — ALREADY BUILT AND TESTED

The website side is finished

- A tour block on every project page — the project's own image, a *Start the virtual tour* button, and a caption naming what you are walking through and when it was scanned.
- **It loads only when clicked.** A tour is tens of megabytes. Most of your buyers are on a phone on mobile data, and nobody should pay for a walkthrough they did not open.
- **The link is checked against the platform it claims to be from.** An embedded frame runs somebody else's code inside your visitor's browser session, so a mistyped or tampered link is rejected before it can reach the page. Tested against the usual tricks.
- Works with Matterport, iStaging, Kuula, CloudPano and Shapspark. Adding another is a small change.

Sending one link per project is all that is needed to make them live.

Pick a platform

Different platforms, different costs and different capture methods. This is your call, not ours, but the shape of it:

PLATFORM	HOW THE TOUR IS MADE	SUITS
Matterport	Operator scans the room with a Matterport or compatible camera	Finished rooms. The most familiar experience; dollhouse and floor-plan views.
iStaging	360° camera, or panoramas rendered from a model	Both built and unbuilt. What four of Aurelia's five tours use.
Kuula / CloudPano	360° photos or renders, stitched into a tour	Lowest cost. Good where a full scan is not warranted.
Shapespark	Built from the 3D model — no camera at all	Unbuilt projects, if the architect's models can be exported.

We need from you: which platform, who holds the account, and who is paying — you, or a vendor who bundles it with the shoot.

What each of the nine actually needs

The nine are not in the same situation. Four are finished and can be scanned next week; three are under construction and need renders until a show unit exists; two are plotted land with no interior to walk through at all.

PROJECT	STATUS	WHAT A TOUR WOULD BE	WHAT WE NEED FROM YOU
Happiness 1	Completed · 26 villas	Scan of a finished villa	Access to one villa, and the owner's consent if occupied
Happiness 2	Completed · 34 homes	Scan of a finished villa	Which of the eight villa types to scan — they differ in size and facing
Blessed	Completed · 21 apartments	Scan of a finished flat	Access to one flat; 2 BHK or 3 BHK
Meraki	Completed · 9 apartments	Scan of a finished flat	Access to one flat — all nine are 3 BHK, so any is representative
Curve	Ongoing · 32 apartments	Rendered panoramas now; scan when a show flat exists	The architect's 3D model, or a date for the show flat
H4	Ongoing · 51 villas	Rendered panoramas; with-lift and without-lift differ	The model, and which of the two villa types to show
V4	Ongoing · 24 apartments	Rendered panoramas	The architect's 3D model
Fadal	Ongoing · 43 plots	No interior. A 360° from the site, or an aerial	Confirm whether a land tour is wanted at all
Rare Earth	Ongoing · 279 plots	No interior. Site 360°, entrance archway, the parks	Same — confirm whether it is wanted

The quickest win: the four completed projects can be scanned as soon as a camera operator is booked and access is arranged. Those four tours could be live within days of the files arriving.

The 3D models, and what format

Curve, H4 and V4 cannot be scanned — they are not finished. Their tours have to come from the architect's model. The Drive holds SketchUp files, which is exactly the right starting point, but we need them in a form a tour platform accepts.

Either of these works, and the architect will know which is easier:

- **360° panorama renders** — one equirectangular image per room or viewpoint, at 8000 × 4000 pixels or larger. Any platform accepts these.
- **A glTF or .glb export** of the model, if you would rather have a walkable tour built from the geometry (the Shapspark route).

The **.skp** and **.dwg** files as they sit on the Drive cannot be used directly — no browser or tour platform reads them. The export is a few minutes' work for whoever holds the original files.

Five fields, once a tour exists

FIELD	EXAMPLE	WHY
Platform	Matterport	Sets which links are trusted
Tour link	https://my.matterport.com/show/?m=...	What gets embedded
What it shows	"the three-bedroom show flat"	Printed under the tour
Date scanned	2026-10-02	Omit for a rendered tour
Show unit?	Yes — furnished show flat	See the note below

One disclosure point worth deciding now. A furnished show flat is not the flat a buyer is sold, and a rendered tour is not a photograph of anything that exists. On a RERA-registered site, presenting either as the delivered product is the kind of claim that causes trouble later. We will caption tours accordingly — "show flat", or "rendered from the architect's model" — unless you direct otherwise. Please confirm you are content with that.

What we need answered to proceed

1. Which platform, and who holds the account?
2. Are you booking the camera operator, or should we source quotes in Mysuru?
3. For the four completed projects — who arranges access, and by when?
4. Happiness 2 has eight villa types. Which one gets scanned?
5. Blessed has 2 BHK and 3 BHK. Which one?
6. H4 has with-lift and without-lift villas. One tour or two?
7. Do Fadal and Rare Earth get land tours, or no tour at all?
8. Can the architect export 360° panoramas, or .glb, from the SketchUp models for Curve, H4 and V4?
9. Is there a budget ceiling per project we should design around?
10. Do you want a single *Virtual Tours* page listing every tour, as Aurelia has, in addition to the block on each project page?
